

FITBUDDY

AI-Powered Personalized Workout and Wellness Assistant

PHASE 07

Project Documentation Phase

Provide the operational guide required to install, configure, run, test, and maintain FitBuddy.

Prepared for phase-wise submission

30 September 2026

Phase objective: Provide the operational guide required to install, configure, run, test, and maintain FitBuddy.

1. Installation Guide - Windows + VS Code

- Open the extracted FitBuddy folder in VS Code - specifically the folder that contains requirements.txt.
- Open Terminal -> New Terminal.
- Create the virtual environment: `python -m venv .venv`
- Activate PowerShell environment: `.\venv\Scripts\Activate.ps1`
- Install dependencies: `pip install -r requirements.txt`
- Create environment file: `Copy-Item .env.example .env`
- Run tests: `pytest -q`
- Start server: `uvicorn app.main:app --reload`
- Open: `http://127.0.0.1:8000`

2. Environment Configuration

- `GEMINI_API_KEY`: optional during mock mode; required for live Gemini calls.
- `GEMINI_WORKOUT_MODEL`: configurable workout model identifier.
- `GEMINI_FAST_MODEL`: configurable fast/nutrition model identifier.
- `MOCK_AI=true`: local/offline mock generation. Set false only when live AI is configured.
- `DATABASE_URL`: default SQLite database under `data/fitbuddy.db`.
- `APP_NAME`: application title/name.

3. Usage Guide

- Enter a unique user ID and profile information.
- Select a goal and intensity, then generate the plan.
- Review the seven days and nutrition/recovery guidance.
- Submit feedback to request changes.
- Open `/view-all-users` to inspect locally stored users.
- Open `/docs` for interactive API documentation.

4. Troubleshooting

- Requirements file not found: make sure the VS Code terminal is inside the folder containing requirements.txt.
- python not recognized: try `py --version` and use `py` instead of `python` if available.
- PowerShell script blocked: run `Set-ExecutionPolicy RemoteSigned -Scope CurrentUser`, then activate `.venv` again.
- Gemini key/model error: verify `.env`, use a valid model for the account, or temporarily use `MOCK_AI=true`.
- Port busy: stop another Uvicorn process or start Uvicorn on another local port.

5. Maintenance and Security Notes

- Do not commit `.env` or API keys to source control.
- The current local admin/users route is intentionally simple and has no authentication.
- Public deployment should add authentication/authorization, CSRF protection where applicable, hardened settings, and production database practices.
- Review AI-generated wellness guidance before presenting it as real-world advice.

Operational URLs

URL	Purpose
http://127.0.0.1:8000/	FitBuddy home page
http://127.0.0.1:8000/docs	Swagger API documentation
http://127.0.0.1:8000/health	Health check
http://127.0.0.1:8000/view-all-users	Local stored-users view

Phase Deliverables / Evidence

- Setup and operating instructions
- Configuration reference
- Troubleshooting and security notes

Submission Note

This phase document is intended to be submitted together with the corresponding FitBuddy source project and evidence captured during execution. Keep API keys, personal credentials, and other secrets out of screenshots and submissions.
